

ABSTRACT OF THE DISCLOSURE

An apparatus is provided which allows a user, while surely rejecting unwanted electric messages with a white
5 list, to browse the rejected messages so as to check their contents. Electric messages from persons unlisted on the permitted-sender list are accumulated in the message holder, and upon receipt of a browsing request from a user terminal, the messages stored in the message holder
10 are permitted to be browsed by the user. While the user is browsing the messages on the user terminal, a link is established between the sender information and the permitted-sender list, and the sender information is added/registered to the permitted-sender list, in
15 response to the user selecting the sender information of the electronic message on the user terminal. This apparatus is applicable to a system for electronically delivering electronic mail such as e-mail and voice mail that is sent directly to mobile telephones.
